Revision 0.1	2003-11-14	RA
	First version	

This HOWTO tries to teach you to run a web based sequence analysis program using basic SimpleAnalysis rules.

Table of Contents

3. Retrieving results

If the run() method executes successfully, the raw output (stripped of HTML) is now stored in the Analysis object. All modules should return the raw report by a call to result() with no parameters. e.g.,

```
my $raw_report = $tool->result();
```

A second way is to retrieve a ready-parsed data structure:

```
my $parsed_report = $tool->result('parsed');
```

The data structure returned is described in the $RESULT_SPEC->{'raw'} hash reference and should al

returns an array of scores for the whole sequence. The names of individual meta sequence names are listed in the module documentation.

8. Acknowledgments

These modules depend on several recently developed modules and wouldn't w
